PRINTED ON RECYCLED PAPER

As used here, "relative" indicates the spectra have been smoothed by the three-dimensional surface drawing routine. Consequently, extremely high- and low-energy density values are modified to produce a smooth surface. The figures are not intended for quantitative measurements; however, they do provide the energy density as a function of frequency relative to the other spectra for the month.

Monthly and annual wave statistics for Gauge 111 for 1993 and for 1985 through 1993 are presented in Table C7.

Figure C9 plots monthly time histories of wave height and period.

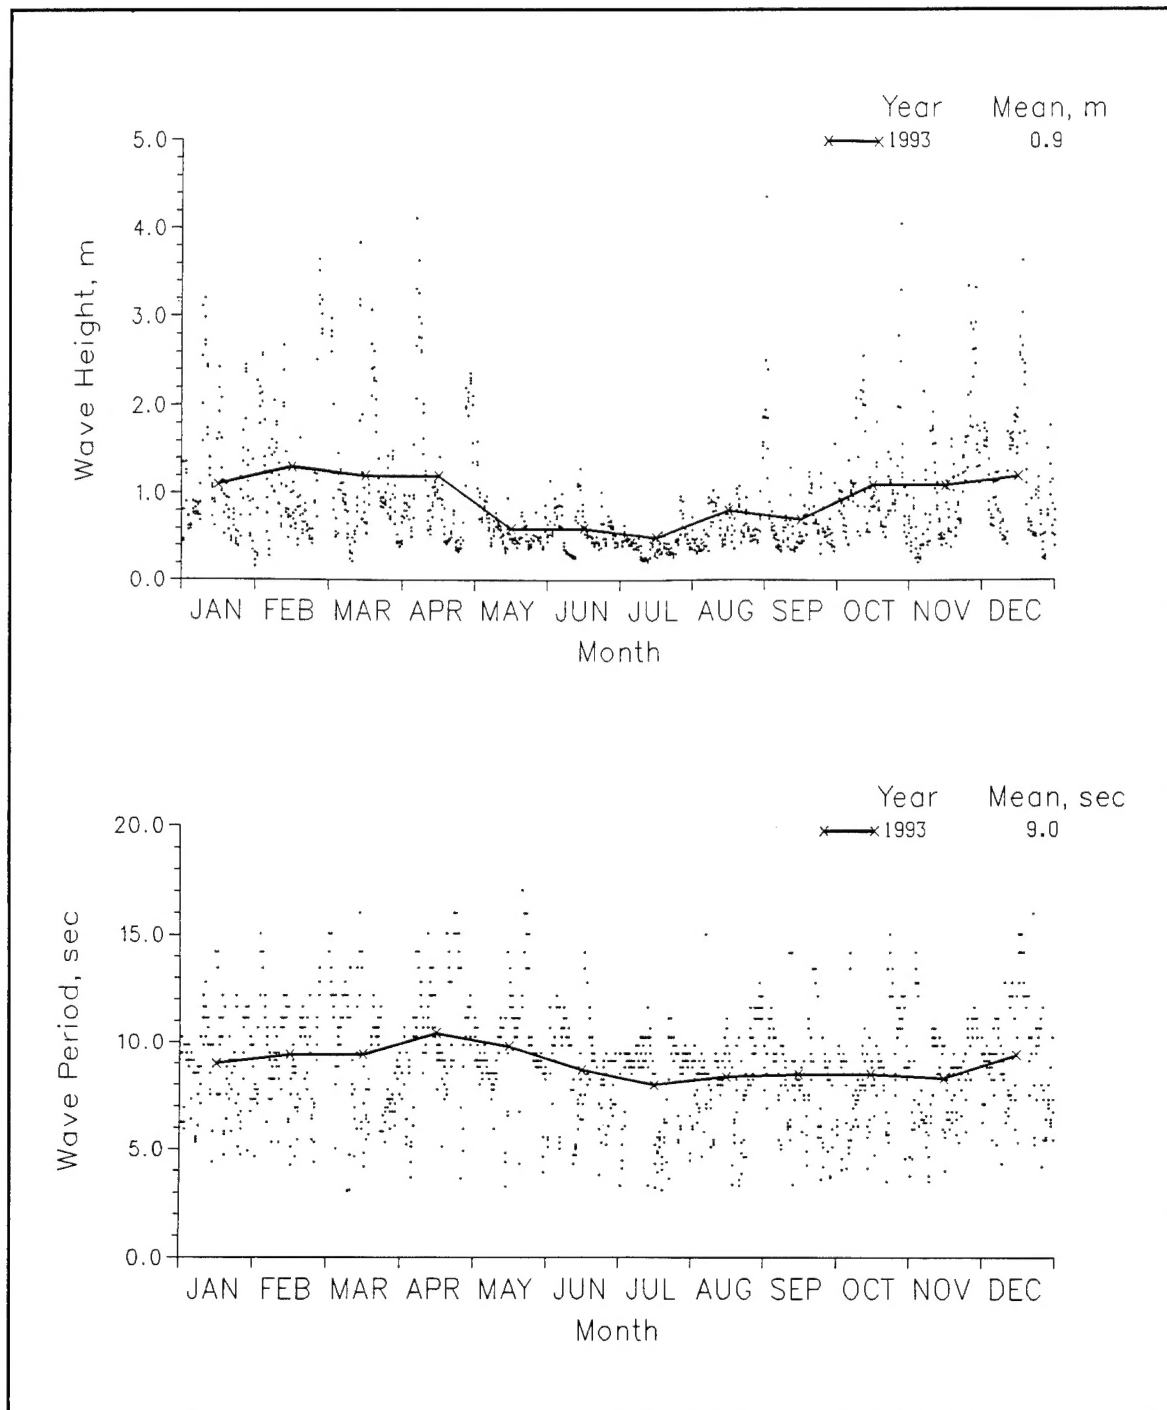

Figure C1. 1993 daily wave height and period values with monthly means for Gauge 111

Figure C9. Time-histories of wave height and period for Gauge 111

Appendix D

Wave Data for Gauge 625

Wave data summaries for Gauge 625 for 1993 and for 1980 through 1993 are presented in the following pages:

Daily H_{mo} and T_p

Figure D1 displays the individual wave height H_{mo} and peak spectral wave period T_p values, along with the monthly mean values.

Joint Distributions of H_{mo} and T_p

Annual and monthly joint distribution tables are presented in Tables D1 and D2, and data for 1980 through 1993 are in Tables D3 and D4. Each table gives the frequency (in parts per 10,000) for which the wave height and peak period were within the specified intervals; these values can be converted to percentages by dividing by 100. Marginal totals are also included. The row total gives the number of observations out of 10,000 that fell within each specified peak period interval. The column total gives the number of observations out of 10,000 that fell within each specified wave height interval.

Cumulative Distributions of Wave Height

Annual and monthly wave height distributions for 1993 are plotted in cumulative form in Figures D2 and D3. Data for 1980 through 1993 are plotted in Figure D4.

Peak Spectral Wave Period Distributions

Annual and monthly peak wave period T_p distribution histograms for 1993 are presented in Figures D5 and D6. Data for 1980 through 1993 are presented in Figure D7.

Persistence of Wave Heights

Table D5 shows the number of times in 1993 when the specified wave height was equaled or exceeded at least once during each day for the duration (consecutive days). Data for 1980 through 1993 are averaged and given in Table D6. An example is shown below:

Height m	Consecutive Day(s) or Longer																		
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19+
0.5	18	15		14	13	12		11	10	9						8			
1.0	50	34	24	21	18	14	12	8	7	3			2						
1.5	41	19	8	6	2	1													
2.0	22	9	5	1															
2.5	10	5	2																
3.0	6	1																	
3.5		1																	
4.0	1																		

This example indicates that wave heights equaled or exceeded 1.0 m 50 times for at least 1 day; 34 times for at least 2 days; 24 times for at least 3 days, etc. Therefore, on 16 occasions the height equaled or exceeded 1.0 m for 1 day exactly ($50 - 34 = 16$); on 10 occasions for 2 days; on 3 occasions for 3 days, etc. Note that the height exceeded 1 m 50 times for 1 day or longer, while heights exceeded 0.5 m only 18 times for this same duration. This change in durations occurred because the longer durations of lower waves may be interspersed with shorter, but more frequent, intervals of higher waves. For example, one of the times that the wave heights exceeded 0.5 m for 16 days may have represented three times the height exceeded 1 m for shorter durations.

Spectra

Monthly spectra for the offshore staff gauge (Gauge 625) are presented in Figure D8. The plots show "relative" energy density as a function of wave frequency. These figures summarize the large number of spectra for each month. The figures emphasize the higher energy density associated with storms, as well as the general shifts in energy density to different frequencies.

As used here, "relative" indicates the spectra have been smoothed by the three-dimensional surface drawing routine. Consequently, extremely high- and low-energy density values are modified to produce a smooth surface. The figures are not intended for quantitative measurements; however, they do provide the energy density as a function of frequency relative to the other spectra for the month.

Monthly and annual wave statistics for Gauge 625 for 1993 and for 1980 through 1993 are presented in Table D7.

Figure D9 plots monthly time histories of wave height and period.

Figure D9. Time-histories of wave height and period for Gauge 625

Appendix E

Wave Data for Gauge 641

Wave data summaries for Gauge 641 for 1993 and for 1980 through 1993¹ are presented in the following pages:

Daily H_{mo} and T_p

Figure E1 displays the individual wave height H_{mo} and peak spectral wave period T_p values, along with the monthly mean values.

Joint Distributions of H_{mo} and T_p

Annual and monthly joint distribution tables are presented in Tables E1 and E2, and data for 1980 through 1993 are in Tables E3 and E4. Each table gives the frequency (in parts per 10,000) for which the wave height and peak period were within the specified intervals; these values can be converted to percentages by dividing by 100. Marginal totals are also included. The row total gives the number of observations out of 10,000 that fell within each specified peak period interval. The column total gives the number of observations out of 10,000 that fell within each specified wave height interval.

Cumulative Distributions of Wave Height

Annual and monthly wave height distributions for 1993 are plotted in cumulative form in Figures E2 and E3. Data for 1980 through 1993 are plotted in Figure E4.

¹ Data from 1980 through May 1992 are from staff Gauge 645 which was replaced by pressure Gauge 641 in November 1992.

Peak Spectral Wave Period Distributions

Annual and monthly peak wave period T_p distribution histograms for 1993 are presented in Figures E5 and E6. Data for 1980 through 1993 are presented in Figure E7.

Persistence of Wave Heights

Table E5 shows the number of times in 1993 when the specified wave height was equaled or exceeded at least once during each day for the duration (consecutive days). Data for 1980 through 1993 are averaged and given in Table E6. An example is shown below:

Height m	Consecutive Day(s) or Longer																		
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19+
0.5	18	15		14	13	12		11	10	9				8		7			
1.0	50	34	24	21	18	14	12	8	7	3			2						
1.5	41	19	8	6	2	1													
2.0	22	9	5	1															
2.5	10	5	2																
3.0	6	1																	
3.5		1																	
4.0	1																		

This example indicates that wave heights equaled or exceeded 1.0 m 50 times for at least 1 day; 34 times for at least 2 days; 24 times for at least 3 days, etc. Therefore, on 16 occasions the height equaled or exceeded 1.0 m for 1 day exactly ($50 - 34 = 16$); on 10 occasions for 2 days; on 3 occasions for 3 days, etc. Note that the height exceeded 1 m 50 times for 1 day or longer, while heights exceeded 0.5 m only 18 times for this same duration. This change in durations occurred because the longer durations of lower waves may be interspersed with shorter, but more frequent, intervals of higher waves. For example, one of the times that the wave heights exceeded 0.5 m for 16 days may have represented three times the height exceeded 1 m for shorter durations.

Spectra

Monthly spectra for the inshore pressure gauge (Gauge 641) are presented in Figure E8. The plots show "relative" energy density as a function of wave frequency. These figures summarize the large number of spectra for each month. The figures emphasize the higher energy density associated with storms, as well as the general shifts in energy density to different frequencies.

As used here, "relative" indicates the spectra have been smoothed by the three-dimensional surface drawing routine. Consequently, extremely high- and low-energy density values are modified to produce a smooth surface. The figures are not intended for quantitative measurements; however, they do provide the energy density as a function of frequency relative to the other spectra for the month.

Monthly and annual wave statistics for Gauge 641 for 1993 and for 1980 through 1993 are presented in Table E7.

Figure E9 plots monthly time histories of wave height and period.

13. ABSTRACT (Maximum 200 words) This report provides basic data and summaries for the measurements made during 1993 at the U.S. Army Engineer Waterways Experiment Station (WES), Coastal Engineering Research Center's (CERC's) Field Research Facility (FRF) in Duck, NC. The report includes comparisons of the present year's data with cumulative statistics from 1980 to the present. Summarized in this report are meteorological and oceanographic data, monthly bathymetric survey results, samples of biannual aerial photography, and descriptions of 15 storms that occurred during the year. The year was highlighted by a major storm in mid March which caused extensive flooding and damage on the western (soundside) side of the Outer Banks. This report is the 15th in a series of annual summaries of data collected at the FRF that began with Miscellaneous Report CERC-82-16, which summarizes data collected during 1977-1979. These reports are available from the WES Technical Report Distribution Section of the Information Technology Laboratory, Vicksburg, MS.
